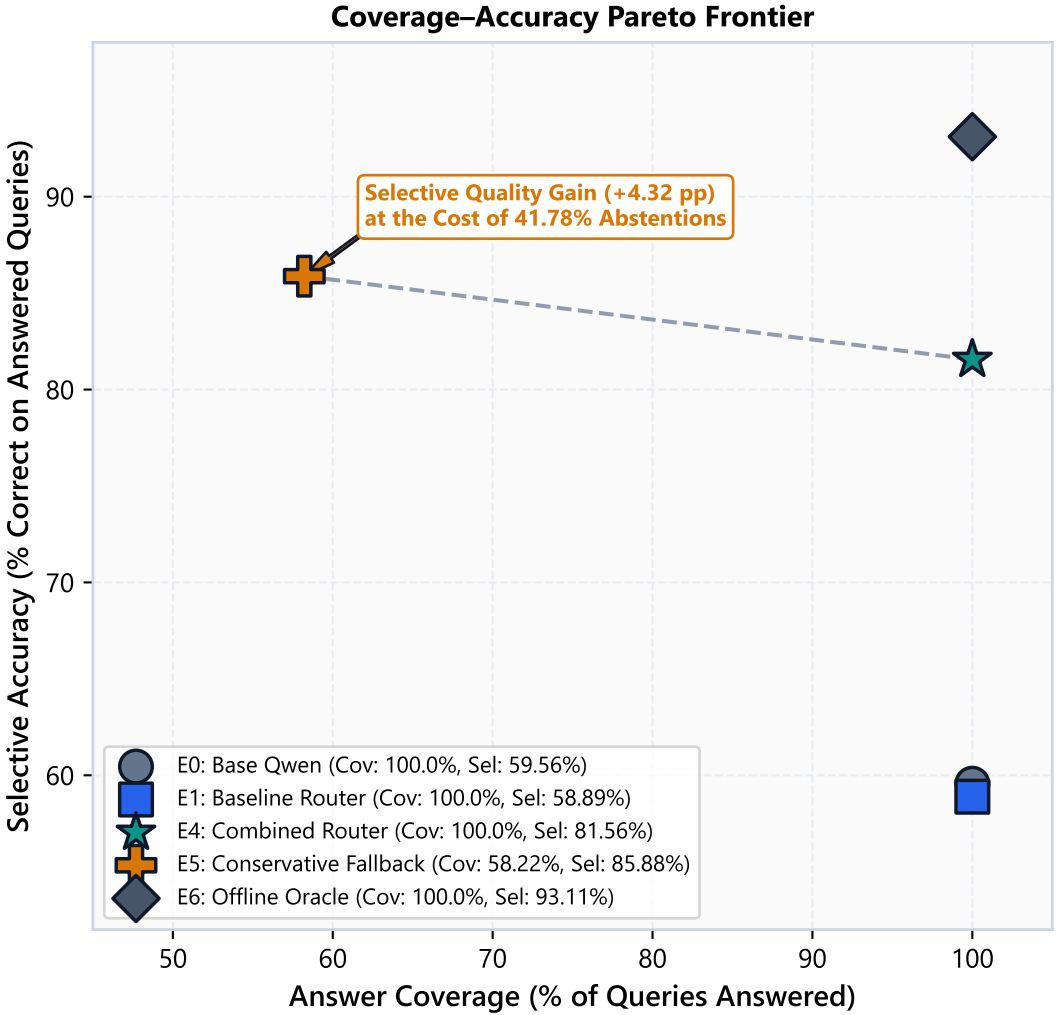

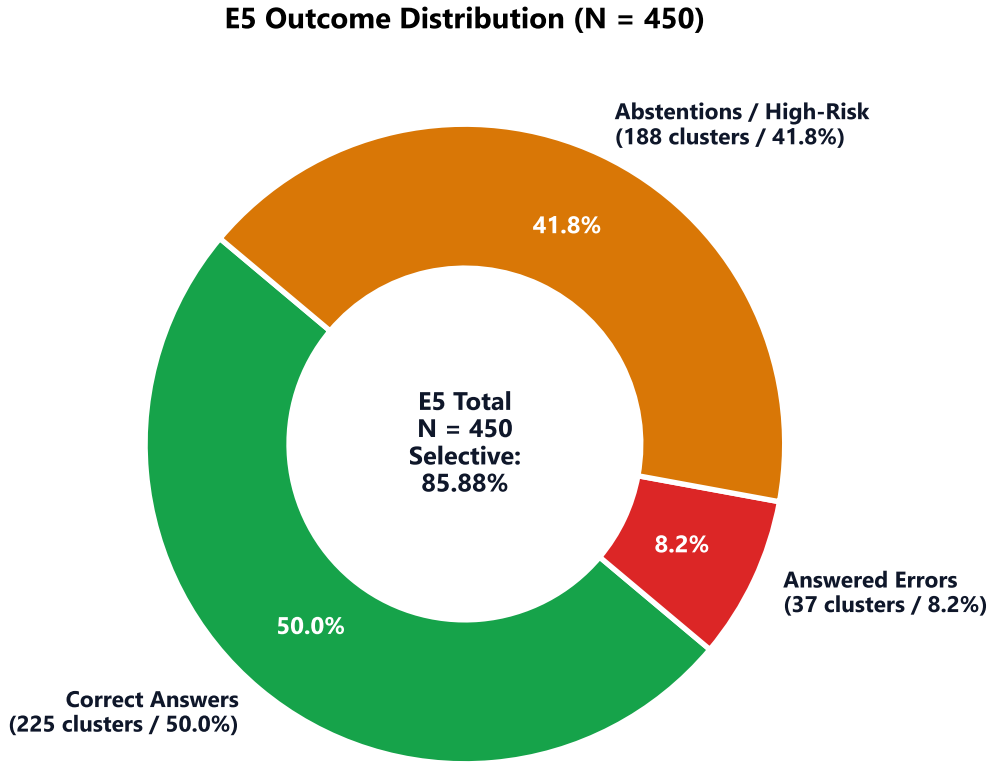

Figure 5: Answer Coverage versus Selective Accuracy Trade-Off in Condition E5
Clarifying the Essential Operational Distinction Between Selective Accuracy (85.88%) and Penalized Gross Accuracy (50.00%)

Statistical Rule: In strict primary benchmarking, abstentions are scored as 0.0 (Gross Acc = 225/450 = 50.00%).
In safety-critical workflows, refusing to guess on ambiguous queries drives selective reliability to 85.88% (225/262).
